

ADYAPAN CRM

Executive Engineering Status & Deliverables Report

Prepared For: Founder, ADYAPAN	Date:	June 26, 2026
Prepared By: Gulshan Kumar (Lead CRM Engineer)	Status:	Production-Ready & Deployed

■ 100% OPERATIONAL & FIELD TESTED

This executive report outlines the engineering deliverables, features, and platform upgrades successfully implemented for the **ADYAPAN CRM** system. All modules are fully operational, compile without errors, and have been successfully pushed to the central code repository.

1. Geotagged Attendance & Automated Payroll

- **Strict Geotagged Clock-In/Clock-Out:** Implemented fine-grained GPS coordinate tracking during attendance submissions. Lateness triggers mandatory reason inputs for administrative reviews.
- **Grace Period Rules:** Configured automated logic where clocking in between 11:05 AM and 11:10 AM is excused up to 3 times a month. Subsequent late entries automatically categorize as a *Half Day*.
- **Early Departure Guard:** Programmed system verification requiring a minimum of 2.5 hours worked per session. Failing to meet this threshold automatically marks the attendance record as *Absent*.
- **Native PDF Payslip Generator:** Built a native PdfDocument layout drawing engine directly on the device. Generates clean, download-ready payslips calculating worked days and deducting absent records. Integrates system sharing to send slips via mail/chat in one tap.
- **Tuesday Off Integration:** Updated payroll calculation rules to exclude Tuesdays from mandatory working days, matching organizational policies.

2. Background Call Logs & Automated Dialer

- **Foreground Telephony Monitoring Service:** Developed a persistent CallMonitorService utilizing a CallLog.Calls observer. Intercepts outgoing call statuses and computes the exact duration in seconds to prevent manual logging errors.

- **In-App Dialog Overlay:** Designed a transparent dialog overlay rendering instantly upon call completion. Prompts counselors to choose feedback codes (Connected, Busy, Callback, etc.) with a fixed safety handler preventing crashes during late-night call feedback inputs.

3. Document Verification & Verification Portals

- **4-Tab Onboarding Profile Form:** Created a multi-page employee form categorizing fields under Personal, Job, Bank, and Documents (Aadhar, PAN, Marksheets) for profile submissions.
- **Secure Firebase Storage Uploads:** Form documents upload to specific folders (`employee_docs/{uid}/`) and sync metadata into Firestore.

HR Documents Audit Panel: Built a 3-tab HR dashboard allowing executives to:

- Distribute corporate guideline documents.
- Monitor employee onboarding progress (e.g. 26/26 fields filled, 10/10 documents uploaded).
- Inspect detail views of employee profiles and download submitted onboarding documents.

4. Cross-Platform Parity & SQLite Integration

- **Unified SQLite Storage (`crm_database`):** Migrated the Flutter database to read/write directly from Room's `crm_database` file, ensuring data parity between native and Flutter interfaces on the same device.
- **Schema Upgrade:** Aligned local schemas to match Room's Version 12, adding missing columns (`duration` in leads, `note` in call records).
- **Expected Sales & Admin Target:** Integrated Firebase Realtime Database listeners. Employees can view targets and log daily Expected Sales directly from the dashboard, syncing instantly to management consoles.
- **Thought of the Day:** Set up real-time listeners fetching daily motivation directly from Firestore settings, rendering it in a styled orange-accent box on the dashboard.

5. Security Controls & Access Roles

- **Supabase Integration:** Integrated background synchronization (`SupabaseSync`) to fetch designations and roles from Supabase, updating Firestore profiles in real-time.
- **Role-Based Navigation:** Automated menu styling to show or hide administrative actions (leaves approval, performance audits) depending on whether the user is logged in as Admin,

HR, or Counselor.

Git Status Update: All changes have been committed cleanly and pushed to the remote master branch at <https://github.com/GulshanKumar21/LeadDialer.git>. The Android package (`com.adyapan.leaddialer`) is active on the Play Store Closed Alpha track with registered testers.
